CENTRE NUMBER	CANDIDATE NUMBER
CHEMISTRY	0620/31
Paper 3 (Extended)	May/June 2013

Candidates answer on the Question Paper.

No Additional Materials are required.

## **READ THESE INSTRUCTIONS FIRST**

Write your Centre number, candidate number and name on all the work you hand in.

Write in dark blue or black pen.

You may use a pencil for any diagrams, graphs or rough working.

Do not use staples, paper clips, highlighters, glue or correction fluid.

DO NOT WRITE IN ANY BARCODES.

Answer all questions.

Electronic calculators may be used.

A copy of the Periodic Table is printed on page 12.

You may lose marks if you do not show your working or if you do not use appropriate units.

At the end of the examination, fasten all your work securely together.

The number of marks is given in brackets [ ] at the end of each question or part question.

1 Petroleum contains hydrocarbons which are separ			um contains hydrocarbons which are separated by fractional distillation.	
	(a)	(i)	Complete the following definition of a hydrocarbon.	
			A hydrocarbon is a compound which	
				[2]
		(ii)	Explain what is meant by the term fractional distillation.	
	(b)		me of the fractions obtained from petroleum are given below. te a use for each fraction.	
		bitu	men	
		lubr	ricating fraction	
		para	affin fraction	
		gas	soline fraction	[4]
				[Total: 8]
2	An	elem	nent, $\mathbf{M}$ , has the electron distribution 2 + 8 + 18 + 3.	
	(a)	Wh	ich group in the Periodic Table is element <b>M</b> likely to be in?	
				[1]
	(b)		dict whether element <b>M</b> is a poor or a good conductor of electricity. e a reason for your answer.	[41]
	(2)	Din	ary compounds contain two atoms nor malegula, for example LIC1	[1]
	(0)		ary compounds contain two atoms per molecule, for example HC <i>l</i> . ntify an element which could form a binary compound with element <b>M</b> .	[1]
	(d)	Pre	dict the formula of the sulfate of $\mathbf{M}$ . The formula of the sulfate ion is $\mathrm{SO_4^{2-}}$ .	
				[1]

For
Examiner's
Use

(e)	The hydroxide of <b>M</b> is a white powder which is insoluble in water.  Describe how you could show that this hydroxide is amphoteric.		
	[2]		
	[4]		
	[Total: 6]		

3 A small piece of marble, CaCO<sub>3</sub>, was added to 5.0 cm<sup>3</sup> of hydrochloric acid, concentration 1.0 mol/dm<sup>3</sup>, at 25 °C. The time taken for the reaction to stop was measured. The experiment was repeated using 5.0 cm<sup>3</sup> of different solutions of acids. The acid was in excess in all of the experiments.

Typical results are given in the table.

experiment	temperature/°C	acid solution	time/min
1	25	hydrochloric acid 1.0 mol/dm <sup>3</sup>	3
2	25	hydrochloric acid 0.5 mol/dm <sup>3</sup>	7
3	25	ethanoic acid 1.0 mol/dm <sup>3</sup>	10
4	15	hydrochloric acid 1.0 mol/dm <sup>3</sup>	8

(a)	(i)	Explain why it is important that the pieces of marble are the same size and the same shape.
		[2]
	(ii)	How would you know when the reaction had stopped?
		[1]

**(b)** The equation for the reaction in experiment 1 is:

$$CaCO_3(s) + 2HCl(aq) \rightarrow CaCl_2(aq) + CO_2(g) + H_2O(l)$$

Complete the following ionic equation.

$$CaCO_{3}(s) \ + \ 2H^{\scriptscriptstyle +}(aq) \ \rightarrow \ \dots \dots \ + \ \dots \dots \ + \ \dots \dots \ + \ \dots \dots \$$

[1]

For Examiner's Use

(c)	(i)	Explain why the reaction in experiment 1 is faster than the reaction in experiment 2.
	(ii)	The acids used for experiment 1 and experiment 3 have the same concentration. Explain why experiment 3 is slower than experiment 1.
(	(iii)	Explain in terms of collisions between reacting particles why experiment 4 is slower than experiment 1.
		[3]
		[Total: 10]
The	stru	octural formula of cyclohexane is drawn below.
		$H_2C$ $CH_2$ $CH_2$ $CH_2$ $CH_2$ $CH_2$ $CH_2$
(a)	Hex	name gives information about the structure of the compound.  A because there are six carbon atoms and <b>cyclo</b> because they are joined in a ring. at information about the structure of this compound is given by the ending <b>ane</b> ?
		[2]
(b)	Wha	at are the molecular and empirical formulae of cyclohexane?
	mol	ecular formula
	emp	pirical formula[2]

4

For

(c)	Draw the structural formula of cyclobutane.	Examiner's Use
	[1]	
(d)	(i) Deduce the molecular formula of hexene.	
	[1]	
	(ii) Explain why cyclohexane and the alkene, hexene, are isomers.	
	[2]	
(e)	Describe a test which would distinguish between cyclohexane and the unsaturated hydrocarbon hexene.	
	test	
	result of test with cyclohexane	
	result of test with hexene	
	[3] [Total: 11]	
	[Total. 11]	

- 5 The reactivity series shows the metals in order of reactivity.
  - (a) The reactivity series can be established using displacement reactions. A piece of zinc is added to aqueous lead nitrate. The zinc becomes coated with a black deposit of lead.

$$Zn + Pb^{2+} \rightarrow Zn^{2+} + Pb$$

Zinc is more reactive than lead.

The reactivity series can be written as a list of ionic equations.

.....  $\rightarrow$  ..... + ..... most reactive metal: the best reductant (reducing agent) Zn  $\rightarrow$  Zn<sup>2+</sup> + 2e<sup>-</sup> Fe  $\rightarrow$  Fe<sup>2+</sup> + 2e<sup>-</sup>

 $Pb \rightarrow Pb^{2+} + 2e^{-}$ 

 $Cu \rightarrow Cu^{2+} + 2e^{-}$ 

 $Ag \rightarrow Ag^+ + e^-$ 

- (i) In the space at the top of the list, write an ionic equation for a metal which is more reactive than zinc. [1]
- (ii) Write an ionic equation for the reaction between aqueous silver(I) nitrate and zinc.

.....[2]

(iii) Explain why the positive ions are likely to be oxidants (oxidising agents).

.....[1]

(iv) Deduce which ion is the best oxidant (oxidising agent).

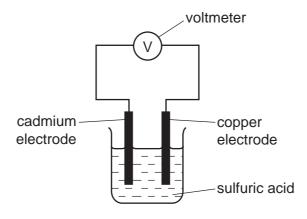

.....[1]

(v) Which ion(s) in the list can oxidise lead metal?

.....[1]

**(b)** A reactivity series can also be established by measuring the voltage of simple cells. The diagram shows a simple cell.

For Examiner's Use

Results from cells using the metals tin, cadmium, zinc and copper are given in the table below.

cell	electrode 1 positive electrode	electrode 2 negative electrode	voltage/volts
1	copper	cadmium	0.74
2	copper	tin	0.48
3	copper	zinc	1.10

		he table to determine this order.
		[3]
		[Total: 9]
6	Ammor weak b	ia is a compound which only contains the elements nitrogen and hydrogen. It is a ase.
	(a) (i)	Define the term base.
		[1]
	(ii)	Given aqueous solutions of ammonia and sodium hydroxide, both having a concentration of $0.1\text{mol/dm}^3$ , how could you show that ammonia is the weaker base?
		[2]

**(b)** Ammonia is manufactured by the Haber Process. The economics of this process require that as much ammonia as possible is made as quickly as possible. Explain how this can be done using the following information.

The conditions for the following reversible reaction are:

- 450°C
- 200 atmospheres pressure
- iron catalyst

	$N_2(g) + 3H_2(g) \rightleftharpoons 2NH_3(g)$	the reaction is exothermic	
•••••			
			[5]

(c) Another compound which contains only nitrogen and hydrogen is hydrazine, N<sub>2</sub>H<sub>4</sub>.

Complete the equation for the preparation of hydrazine from ammonia.

....
$$NH_3 + NaClO \rightarrow N_2H_4 + ..... + H_2O$$
 [2]

(d) The structural formula of hydrazine is given below.

Draw a diagram showing the arrangement of the valency electrons in one molecule of the covalent compound hydrazine.

Use x to represent an electron from a nitrogen atom.

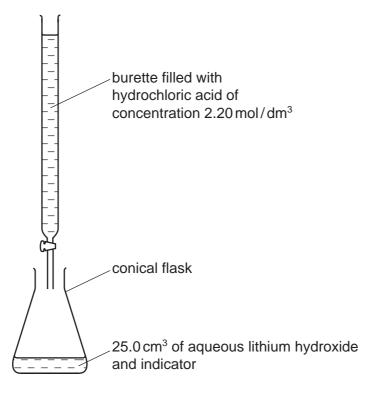

Use o to represent an electron from a hydrogen atom.

For
Examiner's
1100

(e)	Hydrazine is a weak base and it removes	dissolved	oxygen	from	water.	It is	added	to
	water in steel boilers to prevent rusting.							

(i)	One way it reduces the rate of rusting is by changing the pH of water. What effect would hydrazine have on the pH of water?	
		[1]
(ii)	Give a reason, other than pH, why hydrazine reduces the rate of rusting.	
		[1]
	[To	tal: 15]

- 7 The hydroxides of the Group I metals are soluble in water. Most other metal hydroxides are insoluble in water.
  - (a) (i) Crystals of lithium chloride can be prepared from lithium hydroxide by titration.

25.0 cm³ of aqueous lithium hydroxide is pipetted into the conical flask. A few drops of an indicator are added. Dilute hydrochloric acid is added slowly to the alkali until the indicator just changes colour. The volume of acid needed to neutralise the lithium hydroxide is noted.

A neutral solution of lithium chloride, which still contains the how you could obtain a neutral solution of lithium chlorid indicator.	,
maiotor.	
	[2]

For Examiner's Use

	(ii)	You cannot prepare a neutral solution of magnesium chloride by the same method. Describe how you could prepare a neutral solution of magnesium chloride.
		[3]
(b)	to n	e concentration of the hydrochloric acid was 2.20 mol/dm³. The volume of acid needed eutralise the 25.0 cm³ of lithium hydroxide was 20.0 cm³. Calculate the concentration ne aqueous lithium hydroxide.
		$LiOH + HCl \rightarrow LiCl + H_2O$
		[2]
(c)	Whi	ium chloride forms three hydrates. They are LiC <i>l</i> .H <sub>2</sub> O, LiC <i>l</i> .2H <sub>2</sub> O and LiC <i>l</i> .3H <sub>2</sub> O. ich <b>one</b> of these three hydrates contains 45.9% of water? bw how you arrived at your answer.
		ro.
	•••••	[3] [Total: 10]
The	ere a	re three types of giant structure - ionic, metallic and giant covalent.
(a)	In a	n ionic compound, the ions are held in a lattice by strong forces.
	(i)	Explain the term <i>lattice</i> .
		rol
	(ii)	Explain how the ions are held together by strong forces.
		[1]
