| Paper 3 (Exte    | nded)                        | October/November 2009 |
|                  |                              | 1 hour 15 minutes     |
| Candidates ar    | nswer on the Question Paper. |                       |

## **READ THESE INSTRUCTIONS FIRST**

No Additional Materials are required.

Write your Centre number, candidate number and name on all the work you hand in. Write in dark blue or black pen.

You may use a pencil for any diagrams, graphs or rough working.

Do not use staples, paper clips, highlighters, glue or correction fluid.

DO NOT WRITE IN ANY BARCODES.

Answer all questions.

A copy of the Periodic Table is printed on page 16.

At the end of the examination, fasten all your work securely together.

The number of marks is given in brackets [ ] at the end of each question or part questions.

This document consists of 14 printed pages and 2 blank pages.

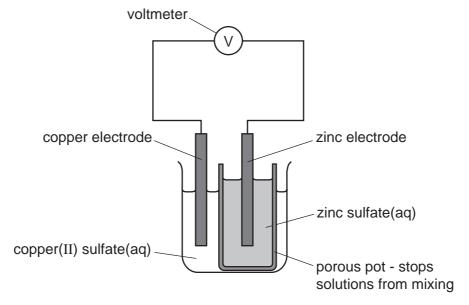

| (a)        | The  | major gases in unpolluted air are 79% nitrogen and 20% oxygen.             |
|------------|------|----------------------------------------------------------------------------|
|            | (i)  | Name another gaseous element in unpolluted air.                            |
|            |      | [1]                                                                        |
| (          | (ii) | Name <b>two</b> compounds in unpolluted air.                               |
|            |      | [2]                                                                        |
|            |      | [2]                                                                        |
| (b)        | Two  | common pollutants in air are carbon monoxide and the oxides of nitrogen.   |
|            | (i)  | Name another pollutant in air.                                             |
|            |      | [1]                                                                        |
| (          | (ii) | Describe how carbon monoxide is formed.                                    |
| `          | (,   |                                                                            |
|            |      |                                                                            |
|            |      |                                                                            |
|            |      | [2]                                                                        |
| (i         | iii) | How are the oxides of nitrogen formed?                                     |
|            |      |                                                                            |
|            |      |                                                                            |
|            |      | [2]                                                                        |
| <i>(</i> : | :\   |                                                                            |
| (1         | IV)  | Explain how a catalytic converter reduces the emission of these two gases. |
|            |      |                                                                            |
|            |      |                                                                            |
|            |      | [2]                                                                        |
|            |      | [Total: 10]                                                                |

Oxides are classified as acidic, basic, neutral and amphoteric. (a) Complete the table. type of oxide pH of solution of oxide example acidic basic neutral [6] (b) (i) Explain the term amphoteric. (ii) Name two reagents that are needed to show that an oxide is amphoteric. [Total: 9]

| (a) An important ore of zinc is zinc blende, ZnS.                                                                                                                       |     |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| (i) How is zinc blende changed into zinc oxide?                                                                                                                         |     |
| (ii) Write a balanced equation for the reduction of zinc oxide to zinc by carbon.                                                                                       | [1] |
|                                                                                                                                                                         | [2] |
| (b) A major use of zinc is galvanizing; steel objects are coated with a thin layer of zinc. This protects the steel from rusting even when the layer of zinc is broken. |     |
| thin layer steel exposed to oxygen and water steel                                                                                                                      |     |
| Explain, by mentioning ions and electrons, why the exposed steel does not rust.                                                                                         |     |
|                                                                                                                                                                         |     |
|                                                                                                                                                                         |     |
|                                                                                                                                                                         |     |
|                                                                                                                                                                         |     |
|                                                                                                                                                                         |     |
|                                                                                                                                                                         | [3] |

For Examiner's Use

(c) Zinc electrodes have been used in cells for many years, one of the first was the Daniel cell in 1831.

| (i)  | Give an explanation for the following in terms of atoms and ions. |     |
|------|-------------------------------------------------------------------|-----|
|      | observation at zinc electrode – the electrode becomes smaller     |     |
|      | explanation                                                       |     |
|      |                                                                   | [1] |
|      | observation at copper electrode – the electrode becomes bigger    |     |
|      | explanation                                                       |     |
|      |                                                                   | [1] |
| (ii) | When a current flows, charged particles move around the circuit.  |     |
|      | What type of particle moves through the electrolytes?             |     |
|      |                                                                   | [1] |
|      | Which particle moves through the wires and the voltmeter?         |     |
|      |                                                                   | [1] |
|      | [Total:                                                           | 10] |

The distinctive smell of the seaside was thought to be caused by ozone, O₃. Ozone is a form of the element oxygen.
 (a) A mixture of oxygen and ozone is formed by passing electric sparks through oxygen.
 3O₂ ⇌ 2O₃

For Examiner's Use

|     |       | $3O_2 \rightleftharpoons 2O_3$                                                                               |
|-----|-------|--------------------------------------------------------------------------------------------------------------|
|     |       | ggest a technique that might separate this mixture. Explain why this method parates the two forms of oxygen. |
|     | te    | chnique                                                                                                      |
|     |       | planation                                                                                                    |
|     |       |                                                                                                              |
|     |       | [2]                                                                                                          |
|     | ••••• | [2]                                                                                                          |
| (b) | Ozo   | one is an oxidant. It can oxidise an iodide to iodine.                                                       |
|     |       | $2I^- + O_3 + 2H^+ \rightarrow I_2 + O_2 + H_2O$                                                             |
|     | (i)   | What would you see when ozone is bubbled through aqueous acidified potassium iodide?                         |
|     |       |                                                                                                              |
|     |       |                                                                                                              |
|     |       |                                                                                                              |
|     |       | [2]                                                                                                          |
|     | (ii)  | Explain in terms of electron transfer why the change from iodide ions to iodine molecules is oxidation.      |
|     |       |                                                                                                              |
|     |       | [1]                                                                                                          |
|     | (iii) | Explain, using your answer to <b>b(ii)</b> , why ozone is the oxidant in this reaction.                      |
|     |       |                                                                                                              |
|     |       | [1]                                                                                                          |

The first three elements in Group IV are carbon, silicon and germanium. The elements and their compounds have similar properties. (a) The compound, silicon carbide, has a macromolecular structure similar to that of diamond. (i) A major use of silicon carbide is to reinforce aluminium alloys which are used in the construction of spacecraft. Suggest **three** of its physical properties. (ii) Complete the following description of the structure of silicon carbide. Each carbon atom is bonded to four atoms. carbon atoms. [2] Each silicon atom is bonded to (b) Germanium(IV) oxide, GeO<sub>2</sub>, has the same macromolecular structure as silicon(IV) oxide. Draw the structural formula of germanium(IV) oxide. [3]

For Examiner's Use

| 7 | Butan-1-ol is used as a solvent for paints and varnishes, to make esters and as a fuel. Butan-1-ol can be manufactured from but-1-ene, which is made from petroleum. |                                                                                      |     |  |  |  |  |
|---|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------|-----|--|--|--|--|
|   | Biobutanol is a fuel of the future. It can be made by the fermentation of almost any form or biomass - grain, straw, leaves etc.                                     |                                                                                      |     |  |  |  |  |
|   | (a) But-1-ene can be obtained from alkanes such as decane, $C_{10}H_{22}$ , by cracking.                                                                             |                                                                                      |     |  |  |  |  |
|   | (i)                                                                                                                                                                  | Give the reaction conditions.                                                        |     |  |  |  |  |
|   |                                                                                                                                                                      |                                                                                      |     |  |  |  |  |
